

SUPERPIN™

Superpin™ electroforms are electroforms for high-performance reflex reflectors.

The unique patented geometry of Superpin™ electroforms concentrates the reflected light into the eye of the observer, greatly improving performance compared to conventional electroforms.

This superior performance, 50% or better according to application, may be used either to guarantee an additional margin of safety in production or to produce extremely small reflex reflectors that would not be feasible with conventional technology.

The images below show the difference in the distribution of light reflected by a conventional reflex reflector and a Superpin™ reflex reflector.

This difference is not visible to the eye and therefore does not cause any styling problems.
